

K Block Foam Generator : LD Series

Description:

The K Block Foam Generator: LD Series is a key piece of equipment used in the production of lightweight concrete. It is the foam generator, in combination with a good quality foaming agent, which determines the quality of the foam (air bubbles – see picture to the right).

K Block Foam Generator: LD Series has been continuously improved in order to produce the best foam possible in terms of both efficiency and quality – producing small strong bubbles that ensure low water absorption, minimum air loss during production and pumping, and no settlement after pouring.

Each foam generator comes with a 3m length of hose and a foam nozzle. Various foam nozzles are available for different foam production rates: from 85 to more than 1,000 litres per minute. They are built to last and be easy to maintain.

Specifications:

Foam Nozzles:

Nozzles are available with foam production rates from 85 to more than 1,000 litres per minute

Electricity Supply: None required – air powered

Air Compressor: Supplies air to the foam generator – minimum 6.0 Bar required, and air production rate depends on foam nozzle size selected

Weight: ~25kg
